

Generated as a review artifact for the PDF export hardening work.

What Changed

- The PDF/print export no longer interpolates RAMS data into an HTML string.
- The export now opens a print window and constructs the document using DOM nodes and textContent.
- Risk labels are normalised to known CSS classes before being applied.
- Generated text, user-entered text, and AI-returned content are treated as text, not executable markup.

Why It Matters

- The previous implementation used document.write with generated RAMS fields embedded directly in HTML.
- HTML-like generated values could alter the exported document structure.
- The new path assigns RAMS content through text nodes.

Verification

- npm run build passes.
- OpenAI calls now use shared error handling through lib/openaiClient.js.
- The job description field is now a larger textarea labelled Tell us about the job.
- Supabase and OpenAI environment variables are present locally.
